▶ Investment commentary

The Bloomberg China Large & Mid Cap UCITS Total Return index gained 4.01% in EUR in April (up 5.89% in USD), underperforming both the MSCI Emerging Markets (up 12.72% in EUR) and the MSCI World (up 7.72% in EUR). April saw a rebound following a period during which equity markets were less sensitive to tensions in the Gulf. The tech sector continued to gain ground over the course of the month, driven by optimism around AI. Chinese Q1 GDP growth surprised observers, rising to 5.3%, which should boost investor confidence. Deflationary pressures also eased significantly over the quarter, supported by higher energy prices.

The Chinese internet segment held steady in the month, while hardware and memory continued to outperform thanks to solid results. Despite a 10% decline in March, investors remained cautious as Q1 earnings season approached. In addition, CATL reported Q1 2026 results showing strong volume growth in the electric vehicle and energy storage segments, highlighting resilience in the face of weak domestic demand for vehicles and tensions in the Middle East.

In AI, DeepSeek launched its fourth version, reiterating China's ability to innovate strongly in this sector. The latest data shows that Chinese AI models can process a comparable number of tokens to US models at a much lower cost. Thanks to its lower energy costs, China is now able to export digital services all over the world.

Against this backdrop, OFI Invest ESG China Equity All Shares fund 3.25% in the month, underperforming its benchmark (up 4.01%) due to its underexposure to IT hardware and its overweight in internet stocks. The world is changing fast with the arrival of AI. Unemployment among 25-29 year olds in China has declined significantly, probably reflecting the impact of AI-related disruption in addition to cyclical factors. The influence of AI is making itself felt in many key sectors of the economy. The AI sector in China is growing fast. LLMs developed by Chinese firms such as DeepSeek, Alibaba and Doubao are at comparable levels to those developed by their US competitors. We remain positive on Chinese markets for the coming months.

Glossary

<p>ALPHA</p> <p>Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.</p>	<p>BETA</p> <p>Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.</p>	<p>RECOVERY PERIOD</p> <p>The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.</p>
<p>SRR</p> <p>The SRR (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».</p>	<p>TRACKING ERROR</p> <p>Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.</p>	<p>VOLATILITY</p> <p>Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.</p>
<p>SHARPE RATIO</p> <p>The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.</p>	<p>SFDR</p> <p>The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.</p>	<p>SRI</p> <p>The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.</p>
<p>SIX FINANCIAL STAR RATING</p> <p>The rating is based on the analysis of the return and risk of each fund within its Europe performance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.</p>	<p>MAXIMUM DRAWDOWN</p> <p>The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.</p>	<p>INFORMATION RATIO</p> <p>The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.</p>
